Expt. No. _____ Page No. 4

Localisation of starch grain from T.S. of Potato tuber.

Requirments:

i) Potato tuber ii) Blade iii) Slide iv) Cover slip v) water vi) Bloating Paper vii) Compound microscope viii) 1% iodine solution.

Method:

i) T.S. of Potato tuber (tissue) was done by hand using blade.
ii) A thin sective was corrected on a clean grase free glass slide.
iii) Use a small drop of 1% iodine solution on the potato section and then place a cover slip on the top of the potato section.
iv) Use a bloating paper to wipe out any extra iodine solution.
v) The slide are observed under the compound microscope.

Observation:

① Numerous starch grains are observed in the potato cells with a specialised organelle amyloplast.

② Under microscope, different size of oval shaped grain with ecentric hila are observed or seen.

③ Some cell show lesser number of grains may be due to loss of grains during section.
